

PRESS RELEASE

Centralized Control of Multiple NetWare Servers with AdRem Software's New Server Manager 5

NEW YORK, October 26, 2005 - AdRem Software, provider of network management solutions, announced today the availability of AdRem Server Manager 5.0, a major new release of its award-winning management solution. Server Manager 5.0 will further reduce the cost of maintaining medium-sized to large NetWare server environments, especially those with various versions of the NetWare operating system.

Version 5 of Server Manager introduces enhancements aimed at easing multiple server administration. Crucial among them is the new monitor console that gives system administrators an enterprise-wide view of all managed servers, complete with key performance indicators illustrating the overall condition of each managed server. Other notable improvements include the ability to compare trends of a single server parameter across multiple servers, copy files from multiple servers to the local workstation, and monitor new performance objects.

Shipped since 1998, Server Manager is AdRem's most mature solution. This Novell-endorsed toolset installs on a Windows workstation and provides a single point of administration for NetWare server performance, configuration, files, users, connections, NetWare Loadable Modules (NLMs), directories, and trustees. With its powerful automation, task scheduling, and cross-server software comparison and distribution capabilities, the program frees server administrators from narrow-focused utilities and repetitive management tasks. All in all, this will help to ensure a predictable and optimized server environment.

"We've been committed to NetWare for quite a long time now and know that there is still a significant number of multiple server environments, especially in educational and governmental organizations. We also know that NetWare technical teams invariably count on our support," explains Borys Skraba, AdRem's International Sales Manager. "With the shipment of Server Manager 5, we're arming them with the most feature-rich and backward-compatible server toolset for NetWare to help them protect and take full advantage of their IT investments through centralized and automated server management."

Pricing, licensing, and availability

AdRem Server Manager 5.0 is available from www.adremsoft.com or from AdRem Software's resellers and sales channel partners worldwide for a US list price of \$595 per single managed server (price includes 12 months of free email and phone support). Volume, educational and governmental discounts are available. Complimentary 30-day evaluation versions are available direct from www.adremsoft.com.

About AdRem Software

AdRem Software was founded in 1998 as a privately held corporation. The company provides rapidly deployable software solutions for monitoring, managing, troubleshooting and securing enterprise networks. The company's products target small and mid-size organizations that seek more efficient and integrated alternatives to point solutions without the prohibitive costs traditionally associated with network management platforms. AdRem's solutions are sold through the corporate website, resellers, distributors, and system integrators in more than 50 countries.

With the company's flagship solution, AdRem NetCrunch, administrators of cross-platform networks can efficiently use their time, budget, and IT resources. The program automatically discovers the physical and logical network topologies, and documents and displays network assets via dynamically updated graphical views. NetCrunch will then begin to proactively monitor network devices, systems, services, and applications without the need to install agents on managed devices. In case of network problems, AdRem's monitoring tool will automatically take corrective action or notify predefined user groups via email, pager, SMS, SNMP, syslog message or ICQ, as well as provide the necessary diagnostic information and tools. Additionally, users can analyze performance trends and receive scheduled reports – also via a web browser – that support informed network capacity planning.
